Machine Coated

We recommend an additional coating applied after installation.

Yakisugi Finishes

Dento

Charred + Oiled

Japanese cedar heat treated and charred then coated with natural oil. The thick layer of carbon gives the timber longevity, UV and weather protection, as well as fire resistance. Natural oil solidifies the carbon layer prolonging the finish by preventing fine layers of soot from coming off.

Traditionally a maintenance optional finish, we recommend re-oiling every 10-20 years to prolong the layer of black carbon.

Makkuro

Charred + Brushed + Oiled

Japanese cedar heat treated and charred then lightly brushed before being factory coated using natural oil to protect and prolong the natural colour of the timber.

The light brush leaves behind a smooth, lightly burned appearance that gains character with age. In Japan, the patina that develops over the years is valued for its beauty. Oil-coating every 5-10 years is recommended.

Wabi Sabi

Charred + Heavy Brush + Oiled

Available in a range of natural oil colours.

Japanese cedar heat treated and charred then brushed twice removing most of the char from the softwood and leaving carbon only on the fine hardwood grain.

Once the softwood is exposed it readily accepts natural colour oils before we do a final factory coat to seal.
